Permanent education: instrument for health management in the Unified Health System (SUS)

Educação permanente: instrumento para la gestión de la salud en el Sistema Único de Salud (SUS)

Educação permanente: instrumento para gestão em saúde no Sistema Único de Saúde (SUS)

ABSTRACT
Objective: to discuss the role of Continuing Education in Health as a tool for health management within the Unified Health System. Method: this is a literature review study, using the Scientific Electronic Library Online as a data source (SciELO), among the inclusion criteria: scientific articles in full text, in Portuguese, English and Spanish, published in the period between 2010-2020. However, scientific articles that escaped the proposed theme were excluded, thus 13 articles were included in the study. Results: Continuing education is capable of providing collective agreements, strategic actions in health, protagonism, transformation of care, management and social control practices and the production of public policies based on SUS principles and guidelines. Conclusion: conceptual changes in the scope of health education are still a challenge for both managers and professionals, therefore, it is necessary to know and encourage the implementation of continuing education in health, especially within the scope of the Unified Health System.

DESCRIPTORS: Continuing education; Health management; Health Unic System.

RESUMEN
Objetivo: discutir el rol de la Educación Continuada en Salud como herramienta para la gestión de la salud dentro del Sistema Único de Salud. Método: se trata de un estudio de revisión de la literatura, utilizando como fuente de datos la Scientific Electronic Library Online (SciELO), entre los criterios de inclusión: artículos científicos en texto completo, en portugués, inglés y español, publicados en el período 2010-2020. Sin embargo, se excluyeron los artículos científicos que escapaban a la temática propuesta, por lo que se incluyeron 13 artículos en el estudio. Resultados: La educación continua es capaz de brindar convenios colectivos, acciones estratégicas en salud, protagonismo, transformación del cuidado, prácticas de gestión y control social y la producción de políticas públicas basadas en los principios y lineamientos del SUS. Conclusión: los cambios conceptuales en el ámbito de la educación en salud siguen siendo un desafío tanto para los gestores como para los profesionales, por lo que es necesario conocer y fomentar la implementación de la educación continua en salud, especialmente en el ámbito del Sistema Único de Salud.

DESCRIPTORRES: Educación continua; Manejo de la salud; Sistema Único de Salud.

RESUMO
Objetivo: discutir sobre o papel da Educação Permanente em Saúde como instrumento para a gestão em saúde no âmbito do Sistema Único de Saúde. Método: trata-se de um estudo de revisão de literatura, tendo como fonte de dados a Scientific Electronic Library Online (SciELO), dentre os critérios de inclusão: artigos científicos em texto completo, com idioma português, inglês e espanhol, publicados no período entre 2010-2020. Entretanto, foram excluídos os artigos científicos que fugiram ao tema proposto, dessa forma foram incluídos ao estudo 13 artigos. Resultados: A educação permanente é capaz de proporcionar acordos coletivos, ações estratégicas em saúde, protagonismo, transformação das práticas de atenção, de gestão e de controle social e produção de políticas públicas fundamentadas nos princípios e nas diretrizes do SUS. Conclusão: as mudanças conceituais no âmbito da educação em saúde configuram-se ainda como um desafio, tanto para gestores e profissionais, portanto, se faz necessário conhecer e incentivar a implementação da educação permanente na saúde, principalmente no âmbito do Sistema Único de Saúde.

DESCRITORES: Educação permanente; Gestão em saúde; Sistema Único de Saúde.

INTRODUCTION

The National Policy for Continuing Health Education (PNEPS - Política Nacional de Educação Permanente em Saúde) was implemented by Brazil in February 2004, through Ordinance GM No. 198/2004, presenting itself as a strategy of the Unified Health System (SUS - Sistema Único de Saúde) that aims at training and development of health workers, proposes in its framework changes in health education activities, where health workers can bring contributions and acquire the ability to recognize themselves as active participants in the training process, while creating new ways of produce health and management in health institutions. Since the entry of Permanent Education in Health (EPS Educação Permanente em Saúde) to the SUS agenda as a public policy, significant changes have been observed in the specific norms that regulate its insertion in the field. 1

EPS is considered a management tool, as it enables the reorganization of the management of health services and systems through problematization, a process guided by the tensions arising from the diversity of interests of management, workers and the population. 2

It is understood that the field of EPS is a process of continuous construction crossed by different logics, which depend on the subjects that are on the scene in the political context, in addition to the ideological and epistemological influences that move these subjects. In this way, the conceptions about EPS are reflected in the normative texts and in the policy operationalization strategies, which demarcate, textually, the discursive expressions that make up the narratives of each period. 1

One of the aspects that has drawn attention in the context of health management, in which the views of managers are particularly concerned with the qualification of human resources, being considered one of the central points of the process of change in management and healthcare in the country. The scarcity of qualified staff to exercise the management of systems and services, in addition to the precariousness of work relationships, added to the inadequacy of profiles and the lack of commitment of most professionals and health workers to the SUS, constitute, today, one of the great challenges to its consolidation. 3

Therefore, this work aims to discuss the role of Permanent Education in Health as an instrument for health management within the Unified Health System.

METHODS

This is a literature review study that sought to collect articles on the interrelationship of continuing education and health management, using the Scientific Electronic Library Online (Scielo) as a data source.

According to the Health Sciences Descriptors (DeCS), the following descriptors were selected: “Educação permanente (Permanence Education)”, “Gestão em Saúde (Health Management)”, “Sistema Único de Saúde (Unified Health System)” in the Portuguese language. The inclusion criteria were: scientific articles, available in full text online, published in Portuguese, English and Spanish, in the temporal scope of the last ten years (2010-2020). As exclusion criteria, scientific articles that escaped the theme of the proposed research were excluded. For the selection of articles and their subsequent inclusion in the results, there was an initial reading of the titles and abstracts. Then, the selected articles were submitted to a more careful evaluation by reading the text in its entirety, being included in the results only those that responded to the theme of the proposed investigation.

Initially, 2,736 publications were surveyed. With the descriptor “Educação permanente”, 1,221 publications were found, applying the following filters: period 2010 to 2020; article; Brazil; Portuguese, English and Spanish resulting in 618 articles. With the descriptor
"Gestão em Saúde" we obtained 4,394 publications, after applying the filters resulted in 1,869 articles in the database. By combining the descriptors “Educação permanente” AND “Gestão em Saúde”, 237 publications were obtained, after applying filters, 186 publications were obtained.

After the searches, according to the previously established inclusion and exclusion criteria and, after analyzing the titles and abstracts, 13 selected studies were obtained for their full reading, included in the results, according to Table 01, presented in the results.

**RESULTS**

Characteristics of the selected studies. The studies selected for this review were numbered and had their titles, authors, year of publication and objectives tabulated for better understanding of each one (Chart 01).
**Discussion**

**Conceptions about continuing education in the context of health services in the Unified Health System**

The edition of ordinance n. 198/04, which established the PNEPS, brings some innovations that represent ruptures in the way of conceiving the training of professionals to work in the SUS. Among these innovations, we have training perceived as a strategic policy of the federal government for the training and development of a set of health professionals, instead of just another specific program of the Ministry of Health.⁵

The EPS consists of a service management policy, in which the qualification of health work processes is based on the problematization of the scenario of practices, with the objectives of resoluteness, integrity and humanization of care.⁶

Continuing education provides, among the actors involved, collective agreements, strategic actions in health, protagonism, transformation of care, management and social control practices and production of policies rooted in the principles and guidelines of the SUS. Therefore, it is important that all professionals are engaged with the PNEP proposal.⁷

A study points out that EPS can be performed through numerous devices, as well as being performed at the research site by the researchers, where resources such as matrix support, institutional support, use of a singular therapeutic project and shared consultation were used during meetings with professionals for discussion of clinical cases.⁸

The research shows that permanent education is configured in two conceptual matrices. The first is characterized by the understanding that health education should promote educational moments, even if individual, in which workers could remedy the knowledge deficit. The second matrix considers health work arising from interprofessional relationships and with users, where it considers this the main device of educational processes.⁹

EPS, as a counter-hegemonic proposal, presents needs and difficulties for health workers who aspire to implement it in their daily lives. Thus, a series of needs are found, among which the following stand out: the support of the team, the creation of spaces for discussion, the valuation of the professional and, above all, the support of the management in the process of implementing the EPS.¹⁰

**Interrelation between management and continuing education in health**

From the 1980s to the 1990s, the construction of the SUS represented a milestone in redefining the direction of health in the country. In this process, not only was the ideological conception of health a right of citizenship redefined, but important initiatives were also launched to support the ide- alization. From a concrete point of view, the training of health personnel took on a new meaning, and with it the EPS is reconfigured with new contours.¹¹

Considering the normative framework with ordinance n. 198/04, the training and development of professionals to work in the SUS began to be referenced in the principles of EPS, which proposed that the training processes aimed at transforming professional practices and the organization of work itself.¹²

Assuming that public policies are the result of a set of actions produced in the territories, the issue of the materialization of these policies by workers in the encounter with users and management can be considered.¹³

Finally, the importance of advancing studies that identify epistemological bases in health management as a path that can bring thinking and doing is shown, as this approach favors the identification of theories that can influence and justify decisions both in micro and macro-political levels.¹⁴

In view of this, it emphasizes that the confrontation of these difficulties identified in the context of EPS has generated the development of several proposals for solutions and arrangements for the management of health workers, particularly at the state and municipal levels, due to the decentralization process.¹⁵

Thus, it is necessary to deepen the interrelationship between subject and management, through the inclusion of the perspective of other actors in the health system or research on other experiences.¹⁶

Thus, this theme leads us to perceive a consensual point between the various authors consulted and also in government policies and programs and international and national organizations, the need for an improvement in the training of health professionals, in particular, as one of the determining elements to solve the crisis in the sector.¹⁷
CONCLUSION

Based on the considerations made, the importance of the dimensions of monitoring and evaluation in the process of implementing a health education policy is highlighted, as they enable the results to be reviewed and modified in the course of activities in order to adapt to local realities. However, it is worth noting that conceptual changes in the scope of health education are still a challenge, both for managers and professionals.

Based on this premise, we leave here the provocation and the invitation to deepen the reflections and development of new investigations that can respond to the concerns raised and the broad challenges of work and education in the context of health management, since it is necessary knowing, monitoring and evaluating the different health education actions within the Unified Health System, as it requires special attention in relation to the implementation of its principles and foundations, such as the component of participation, social control and integrity, among others. 13
