Operative groups as therapeutic for providing healthy habits in diabetic elderly people: An integrative review

Grupos operativos como terapêutica para promoção de hábitos saudáveis com idosos diabéticos: Uma revisão integrativa
Grupos operativos como terapêutico hacia la promoción de hábitos saludables en ancianos diabéticos: una revisión integradora

RESUMO
Objetivo: Realizar uma revisão integrativa da literatura a fim de compreender os grupos operativos como terapêutica para promoção de hábitos saudáveis com idosos diabéticos. Método: Foi feita uma busca das referências nas bases periódicas CAPES, Google Scholar e Pubmed em setembro de 2021. A busca permitiu a identificação de oito artigos que se adequaram aos critérios estabelecidos. Resultados: 50% dos artigos referiram a promoção à saúde dos idosos através da educação em saúde, 25% mencionaram que as atividades grupais contribuem para o autocuidado e a autonomia dos diabéticos e 25% reportaram-se aos grupos operativos como ensaio para a participação ativa de todos os presentes. Conclusão: Os grupos operativos são transformadores para as práticas de conscientização e empoderamento do idoso diabético, pois contribui para sua autonomia, corresponsabilizando-o no processo de adoecimento e cuidados. Ademais, reforça-se a necessidade de mais estudos com a temática voltada aos idosos diabéticos devido à escassez encontrada.

DESCRITORES: Serviços de Saúde para Idosos; Hábitos; Diabetes Mellitus; Terapêutica; Processos Grupais.

ABSTRACT
Objective: The purpose of the present study was to carry out an integrative literature review in order to understand the operative groups as a therapeutic to promote healthy habits with elderly diabetics. Methods: It was made a search of the references in the CAPES Periodicals, Google Scholar and PubMed databases in September 2021. The search allowed the identification of eight papers that met the established criteria. Results: 50% mentioned the promotion of health for the elderly throughout education in health, 25% mentioned that group activities contribute to self-care and autonomy of those living with diabetes mellitus and 25% reported to the operative groups as an opportunity for the active participation of all those present. Conclusion: The operative groups are transformative for the practices of awareness and empowerment of the diabetic elderly, for it contributes to their autonomy, making them co-responsible in their illness and care process. Beyond that, it reinforces the need for more studies with the theme aimed at elderly diabetics due to the shortage found.

1. INTRODUCTION

Type 2 Diabetes Mellitus (DM) is characterized as a metabolic disorder resulting from hyperglycemia. There are also increasing rates of DM carriers due to the physiological changes of aging that lead to the manifestation of Chronic Non-Communicable Diseases (NCDs), which are considered non-modifiable causes.

Since the increase in life expectancy with the process of demographic transition and the change in the scenario from infectious diseases to the predominance of CNCDs, called the epidemiological transition, population aging changes the world scenario. Thus, the elderly population is expected to rise from 900 million in 2015 to 2 billion in 2050, which means a 10% increase in this population. Studies report that 50% of those with DM2 are over 60 years old. Brazil already occupies the 4th position in the World Ranking with the highest number of adults with DM.

In this sense, blood glucose control is achieved through the development of self-care, contributing to a better quality of life and a reduction in the morbidity and mortality profile. Therefore, a new technology in health is the use of Operative Groups (OG). These contribute to health promotion and disease prevention, encouraging individuals to actively participate in their health-disease process and creating a professional-user bond.

The OG was created by Pichon-Revière, a psychiatrist and psychoanalyst, in the 1940s, with the aim of discussing topics based on the reality of the subjects, allowing the clarification of doubts and anxieties of those involved. In this way, the transmission of knowledge is no longer vertical, where the health professional is the center, and allows the active participation and construction of knowledge of the subjects from the transformation of knowledge into attitudes.

Therefore, in order to plan OG with elderly diabetics, health professionals must have a theoretical foundation, considering the health demand brought by the public, with an appreciation of the suggested themes, choice of strategies to be used in the group and evaluation. Thus, it is important to define the days, as well as the place and time of start and end of each meeting, establishing the frequency, the number of participants and the professionals who will work.

In this sense, studies on the impact of group education when compared with individual education with DM2 patients showed that, in a period of six months, there was an improvement in knowledge about the disease, empowerment of participants and self-care management.

In this sense, studies on the impact of group education when compared with individual education with DM2 patients showed that, in a period of six months, there was an improvement in knowledge about the disease, empowerment of participants and self-care management.
in September 2021 in the following databases: CAPES Periodicals, Google Scholar and PubMed, totaling 18,410 articles. After reading the title, abstract and full text, 08 articles were selected and included according to the eligibility criteria. Inclusion criteria were: articles in English, Spanish and Portuguese, published from 2017 to 2021, involving the evaluation of operative groups as a therapeutic intervention on the promotion of healthy habits with diabetic elderly. Exclusion criteria were literature review or meta-analysis articles and articles that did not fit the research theme. The descriptors were searched using the Boolean operator “AND” to create the word pairs. The method used was an Evidence-Based Practice (EBP) instrument, which involves defining the clinical problem, identifying the necessary information, conducting the search for studies in the literature and their critical evaluation, identification of the applicability of data from publications and determination of its use for the patient. 8 Data analysis was performed in an observational and descriptive manner with the purpose of grouping current knowledge on the subject of the review. The survey results were arranged in a frame.

### 4. DISCUSSION

The objective of the present study was to carry out an integrative review of the literature in order to understand the evaluation of operative groups as a therapeutic intervention on the promotion of healthy habits among elderly diabetics.

Thus, working on health education with elderly diabetics, with topics related to healthy eating and physical activity, is essential for the creation and/or adoption of healthy habits. In view of this, some studies analyzed showed that the practice of group activities by DM patients is capable of encouraging changes in the behavior of individuals, thus helping in glycemic control. Thus, in order for health education, in the form of a group activity, to have a positive effect on self-care, it must be clarified to the participants that this is a practice that needs to be constant, because the creation of a professional-user bond will strengthen the continuity of care. For this purpose, there is the Operational Group (GO) which provides the discussion of various topics, facilitating communication, as it allows everyone to talk about their problems seeking a solution consistent with their customs, values, beliefs and cultures.

An example of what was carried out in an OG with elderly diabetics brought in a study allows comparing it to the groups that do not use this methodology and it

is noticed that the theoretical foundation linked to the practices, with a programmed number of meetings allows the growth of the collective, increasing the chances of adherence to therapy.

In addition, the OG is carried out to promote specific care and prevention of complications, as well as stimulate self-care and user autonomy, contributing to empowerment, as the elderly with DM comes to know the disease, its complications, becoming aware of the importance of adopting drug and non-drug treatment.

Thus, the topics to be worked on should not be imposed vertically, as professionals must be able to hear what the elderly need. In this way, the interaction of the diabetic elderly with health professionals facilitates adherence to OG, stimulating social interaction, helping to understand the disease and promoting healthy habits.

**CONCLUSION**

The operative groups were evaluated as transforming the practices of awareness and empowerment of the diabetic elderly, as it contributes to the autonomy of the subject, making him co-responsible in his illness and care process. In this sense, topics relevant to the self-care of the diabetic elderly are discussed, with a previous selection of the topic that will be addressed, based on the contributions of the participants of the groups. In this way, the chances of adherence to the therapeutic plan will increase, making the elderly protagonist in the change of their habits, being important the use of participatory methodologies, with the sharing of experiences and an environment conducive to the construction of collective knowledge.
